Q. 2. Write letters on:- (Any Two) (10)

1. Write a letter to your friend informing them about the competition that you have won recently.
2. Write a letter to the editor of a newspaper complaining against the frequent breakdown of electricity in your locality.
3. Write a letter to 'Jupiter Stationery' placing an order of stationery required for office use.

SECTION - II

Q. 3. Choose the most appropriate option. (20)

- 1) Choose the correctly spelt word

a) dimation	b) daimantion
c) dimension	d) diemansion
- 2) Find the antonym of 'artificial'

a) natural	b) superficial
c) beneficial	d) frugal
- 3) Add a prefix to the word (like) to make a meaningful word

a) nonlike	b) unlikely
c) dislike	d) mislike
- 4) Identify the tense of the following sentence: It takes a lot of patience to create something worthwhile.

a) Simple Present	b) Continuous Present
c) Perfect Present	d) Continuous Perfect Present
- 5) Choose the correct form of adjective to complete the sentence: Green Park is the royal park in London.

a) small	b) smaller
c) smallest	d) none of these
- 6) Fill in the blanks with a suitable article: I saw accident of car.

a) an, a	b) the, an
c) a, an	d) the, a
- 7) Choose the appropriate collective noun: A of drawers.

a) Stack	b) Bundle
c) Heap	d) Chest

whether the snow is wet or dry, and whether it is compacted or not compacted. The four most common types of avalanche are: dry snow, wet snow, wet slab, and dry slab.

The least dangerous type is a dry snow avalanche, which is made up of powdery snow. A dry snow avalanche most often occurs on steeper slopes during a snowstorm when the temperatures are below freezing. Despite the fact that they can reach speeds of up to 225 miles per hour, these avalanches tend to be small, and their snow is loose, not compacted, so they are less dangerous. Yet even a dry snow avalanche can cause harm under the right conditions.

A wet snow avalanche differs from a dry snow avalanche. It consists of loose, partially melted snow and water. Wet snow avalanches generally occur during the springtime when temperatures are consistently above freezing and there is an abundance of both sunshine and rainfall. Wet snow avalanches are the least common type of avalanche, and they are much slower than dry snow avalanches, typically traveling at speeds of only 10-20 miles per hour.

Like a wet snow avalanche, a wet slab avalanche most often occurs during the spring, due to melting snow. This type of avalanche is the slowest, generally traveling at a speed of not more than 10 miles per hour. But because the snow is compacted, not loose, a wet slab avalanche is still quite dangerous even at this slow speed.

The last type, a dry slab avalanche, is the most dangerous of all. It occurs when considerable snowfall accumulates over a layer of existing snow in a very short period of time. Dry slab avalanche, travels at speeds of 60-80 miles per hour. Dry slab avalanches account for roughly 90% of all avalanche-related casualties.

Answer the following questions:

- 1) What is an avalanche?
 - 2) What are the common types of avalanche?
 - 3) Which avalanche is capable of travelling at the highest speed?
 - 4) Which is the most dangerous avalanche?
 - 5) Which natural disaster is the most dangerous according to you? Why?
-
